

Task 4 - Customer Feedback Analysis

Part A - Categorization Prompt

Act as a customer-experience analyst. Analyze each of the 15 feedback entries. Return a table with ID | Category | Sentiment | Key Theme | Priority. Use categories such as Product Quality, Delivery/Shipping, Customer Service, Technical/App, Pricing/Value, or Other. Base the result only on the feedback text. Mark urgent access, refund, failure or purchase-blocking problems as High priority.

Part C - Escalation Prompt

Using the categorized feedback, identify the top 3 urgent issues needing immediate action. For each issue, draft a three-sentence management alert explaining the problem, customer impact and immediate action. Then recommend three concrete process improvements. Use only the feedback dataset.

Top 3 urgent issues

1) F010 account login/reset-password failure: urgent access blocker. 2) F013 mobile website crashes preventing purchase: direct revenue/customer-experience blocker. 3) F004 refund delayed for two weeks with no response: serious service and trust issue.

Top 3 process improvements

1) Create SLA-based escalation for refunds and unanswered support cases. 2) Add monitoring and regression testing for login/password reset and mobile checkout. 3) Create a faster replacement/refund workflow with clear ownership and customer updates.

Developer classifier prompt

Write a Python script that reads feedback.csv and classifies each Feedback Text using the OpenAI API model gpt-4o-mini. Process up to 10 rows per API call, request Category, Sentiment, Key Theme and Priority, handle API/JSON errors without losing completed rows, save feedback_classified.csv, and print sentiment percentages at the end.

Category	Count	% of Total	Dominant Sentiment
Product Quality	4	26.7%	Mixed
Delivery / Shipping	2	13.3%	Mixed
Customer Service	3	20.0%	Mixed
Technical / App	3	20.0%	Mixed/Negative
Pricing / Value	2	13.3%	Neutral/Negative
Other	1	6.7%	Positive
TOTAL	15	100%	Mixed
