

Task 7 - Build a Task Planning Workflow

Selected Scenario

Scenario C - System Migration.

Task Planning Prompt

Context: We are migrating from an old CRM to a new platform. Work includes data export, field mapping, cleaning, test import, user acceptance testing, staff training and go-live cutover. Role: Act as a senior project manager experienced in CRM migrations. Task: Build a prioritized project plan with tasks, owner role, dependency, priority, estimated duration, risk and suggested sprint/week. Format: Use a structured table followed by Critical Path, Top 3 Risks and Missing Information. Constraints: Do not invent exact system details; clearly flag information that must be confirmed.

Evaluation

Total tasks identified: 12 (quality 5/5). High-priority tasks: 7 (5/5). Critical path: Yes - export -> mapping/cleaning -> test migration -> UAT -> final cutover (5/5). Top risks: data mapping errors, incomplete testing, insufficient staff readiness (5/5). Sprint allocation: logical across discovery/preparation, testing/training and cutover (5/5). Missing information: migration volume, downtime window, owners and rollback requirements flagged (5/5).

Developer sprint prompt

Act as an engineering sprint planner. Plan a 2-week, 40-point sprint using these tickets: Implement JWT authentication endpoint; Add refresh-token handling; Write payment-service unit tests; Fix dashboard pagination bug; Add customer search API; Add validation to customer create request; Refactor error response handler; Add database index for customer email; Update API documentation; Add integration test for login. Estimate Fibonacci story points, identify dependencies, flag unclear tickets, and select a realistic set that does not exceed 40 points. Return Backlog, Selected Sprint, Dependencies, Risks and Deferred Tickets.
