

Task 2 - Data Cleaning via AI

Turn 1 - Cleaning Plan Prompt

Review the sales dataset and list the cleaning actions you will take, but do not modify it yet. Include name/status casing, date standardization, missing qty/revenue, the N/A revenue value and the qty=99 outlier. Explain how each issue will be handled.

Turn 2 - Execute Cleaning Prompt

Now apply the approved cleaning plan. Convert rep_name to Title Case, status to Closed/Pending, dates to YYYY-MM-DD, convert N/A revenue to missing then fill missing qty/revenue with 0 while setting data_issue=True for affected rows. Flag qty > 50 as potential_outlier=True. Do not delete the outlier. Return the cleaned CSV.

Verification

rep_name casing: ✓ Title Case. status: ✓ Closed/Pending. dates: ✓ YYYY-MM-DD. missing qty/revenue: ✓ filled/flagged. N/A revenue: ✓ converted and flagged. qty 99: ✓ flagged as outlier.

Outlier decision

I would not remove order 1019 automatically. Qty 99 is unusual, but it may be a real large order. I would flag it and verify it with the source or sales team. Removing it without evidence could make the analysis wrong.

Developer cleaning script prompt

Generate a complete pandas script that loads sales.csv, Title Cases rep_name, normalizes status, parses all dates to YYYY-MM-DD, converts revenue N/A to NaN, creates data_issue=True for rows with missing qty or revenue, fills those missing qty/revenue values with 0, creates potential_outlier=True where qty > 50, and saves sales_clean.csv. Include simple comments and a final cleaning summary.
