

## Task 8 - Design an AI-Powered Automation Workflow

### Selected Pattern

Weekly Report.

### Trigger

Every Sunday at 5:00 PM.

### App / Source

Google Sheets sales sheet.

### Filter

Continue only if the sheet contains rows for the current reporting week.

### AI Step

Validate the supplied weekly rows, summarize metrics, identify risks/outliers and write the weekly management report.

### AI Tool

OpenAI model through an API connection.

### Output

A structured weekly sales report with headline, metrics, risks and three recommendations.

### Destination App

Email draft and a report archive location.

### Notification

Sales manager and project/operations manager.

### Automation Tool

n8n.

### AI Step Prompt Template

Context: The following rows are weekly sales data for [WEEK\_DATE] and [REGION]. Role: Act as a sales analyst. Task: Validate the supplied rows, calculate/summarize the key metrics and write a weekly report. Format: HEADLINE, KEY METRICS, TOP PERFORMERS, ISSUES/RISKS, RECOMMENDATIONS. Maximum 220 words. Constraints: Use only [SALES\_DATA], do not invent causes, flag missing values and outliers, and state when a figure needs verification.

### Developer n8n design prompt

Design a conceptual n8n workflow JSON for a weekly sales report. Include a Schedule Trigger, Google Sheets read node, IF node that stops when no current-week rows exist, HTTP Request node for the AI API, and an email/final action node. Explain each node, key mappings, and credentials required. Do not include real secrets.
