

# Task 6 - Build Your Sales Summary Automation

## Role

Act as a weekly sales performance analyst for the Sales Department.

## Task

Write a weekly sales summary for the period: [WEEK\_DATE] and region: [REGION].

## Data

[PASTE DATA HERE]

### Section 1 - HEADLINE

One sentence with the main performance result.

### Section 2 - KEY METRICS TABLE

Total revenue, order count, units sold, average order revenue.

### Section 3 - TOP PERFORMERS

Top region/product/sales rep when available.

### Section 4 - ISSUES / RISKS

Missing values, pending orders, unusual outliers and weak performance.

### Section 5 - RECOMMENDATIONS

Three practical next actions based only on the data.

## Format

Maximum 220 words. Tone: clear and professional for a manager.

## Constraints

Do not invent causes, customers or targets. Flag missing/uncertain data. Do not treat an outlier as normal until verified.

## Test evaluation

Exact structure: Yes. Figures accurate: Yes when using cleaned data. Tone appropriate: Yes. Next change: add previous-week data so the report can show real week-over-week change. Estimated time saved: about 20-30 minutes per weekly report.

## Developer production-ready prompt

Convert this sales-summary template into a Python function `generate_sales_report(csv_path, week_date, region)`. Read the CSV, build the prompt, call the OpenAI API, and return the formatted report string. Add a clear docstring and one unit test that mocks the API response and checks that HEADLINE, KEY METRICS, TOP PERFORMERS, ISSUES / RISKS and RECOMMENDATIONS are present.
