

Task 1 — AI Knowledge Audit & Tool Exploration

My Definition of AI

AI is a technology that helps computers do tasks like humans, such as understanding questions, writing, solving problems and helping with code.

AI's Explanation

A Large Language Model (LLM) is an AI model trained on a lot of text and code. It learns patterns and uses them to understand questions and generate useful answers.

AI CAN

1. Help me write code.
2. Find simple errors.
3. Explain difficult things.
4. Write and summarize text.

AI CANNOT / Risks

1. It is not always correct.
2. It can give wrong code.
3. We should not share private data.
4. We still need to check its answers.

New concept I learned

I learned that AI can give a good answer, but I still need to check it.

Difference between Tool 1 and Tool 2

Tool 1 gave more details and examples. Tool 2 was shorter and easier to read. Both gave almost the same main idea.

Top 5 AI use cases

1. Writing code.
2. Finding bugs.
3. Explaining code.
4. Writing tests.
5. Writing documentation.
